	Explain the similarities and differences between plant and animal cells.
Z IN	

REA THII EXP	While walking in the woods one day, you come across a strange object. You decide to investigate the object to determine if it is a living organism or not. Explain the characteristics you would look for to determine if the object you found is a living organism.

A meteorite hits the Earth and moves it into another solar system where the climate is very different. Living things must adapt to flooding ten feet above sea level during summer and ten feet of snow in the winter.
Think about the adaptations that living things would have to make in order for life to continue under those conditions.
Now tell a story about how an organism adapted itself to live under those conditions.

REA	D	You are a living organism. Write a letter to Zaar (a creature from out of space) describing what it is like to be a living organism.
